About the SDK SDK Functions Listing Appendix A: What's New

About the Vicon DataStream Software Development Kit (SDK)

The Vicon DataStream Software Development Kit (SDK) allows easy programmable access to the information contained in the Vicon DataStream. The function calls within the SDK allow users to connect to and request data from the Vicon DataStream. The following combinations of platforms and technologies are supported:

	Windows x86 (32-bit)	Windows x64 (64-bit)	Linux x86 (32- bit)	Linux x64 (64- bit)	Mac OSX (64&32-bit)
C++	✓	✓	✓	✓	
.NET	✓	✓			
MATLAB	✓ (can be run on Windows 64-bit OS)	✓ (requires Microsoft Professional compiler)			

Important notes:

- Not all function calls contained within the SDK will return data when connected to certain Vicon Applications. For example, Vicon Blade does not support analog devices, and therefore will not output device information into the DataStream.
- The current DataStream format is supported by Vicon Nexus 1.4+, Vicon Blade 1.6+, and Tracker 1.0+. These applications may also output an additional stream in the legacy "Tarsus" format. This DataStream SDK only accesses the DataStream format.
- The current intention is that all future Vicon applications will support the DataStream format.
- Example files are supplied as unsupported examples only.
- The SDK only supports axis transformations into right handed co-ordinate systems.
- The SDK is designed to allow multiple instances of a Client within a single process which can connect to multiple DataStreams.

The SDK is supplied as shared libraries – DLLs on Windows and SOs on Linux. The shared libraries and supporting files are required to be copied alongside your client executable.

SDK Functions Listing

Appendix A: What's New

Installing on Windows

There are separate installers for the 32-bit and 64-bit SDKs. The 64-bit installer will only work on a 64-bit version of Windows. The default install directories are:

64-bit Windows

- 32-bit SDK: C:\Program Files (x86)\Vicon\DataStream SDK\Win32
- 64-bit SDK: C:\Program Files\Vicon\DataStream SDK\Win64

32-bit Windows

32-bit SDK: C:\Program Files\Vicon\DataStream SDK\Win32

The SDK is supported on Windows 7.

Installing on Linux

The SDK is provided as a compressed archive. Extract the archive into a convenient location on your system.

Installing on Mac OSX

The dylibs should be placed in /usr/lib and marked as executable:

```
sudo cp libViconDataStreamSDK_CPP.dylib /usr/lib
sudo cp libDebugServices.dylib /usr/lib
sudo chmod 755 /usr/lib/libViconDataStreamSDK_CPP.dylib
sudo chmod 755 /usr/lib/libDebugServices.dylib
```

Application linking and redistribution

Windows - C++

The SDK was built using Visual Studio 2013. Your application should

- #include "DataStreamClient.h"
- Link against "ViconDataStreamSDK_CPP.lib"
- Redistribute:
 - "ViconDataStreamSDK CPP.dll"
 - "DebugServices.dll"
 - "boost *-vc120-mt-1_58.dll"
 - "Microsoft.VC12.CRT"

Windows - .NET

Your application should

- Link against the assembly "ViconDataStreamSDK_DotNET.dll".
- Redistribute:
 - "ViconDataStreamSDK DotNET.dll"

SDK Functions Listing

Appendix A: What's New

- "ViconDataStreamSDK_CPP.dll"
- "DebugServices.dll"
- "boost_*-vc120-mt-1_58.dll"
- "Microsoft.VC12 CRT"
- Have the .NET Framework 4.5 or later installed.

The managed code in this assembly requires the unmanaged code in the C++ SDK

SDK Functions Listing

Appendix A: What's New

Windows - MATLAB

Your application M file should be in the same directory as

- "Client.m"
- "DeviceType.m"
- "Direction.m"
- Result.m"
- "StreamMode.m"
- "TimecodeStandard.m"
- "Unit.m"
- "ViconDataStreamSDK_MATLAB.dll"
- "ViconDataStreamSDK_MATLAB.h"
- "DebugServices.dll"
- "boost_*-vc120-mt-1_58.dll
- "Microsoft.VC12.CRT"

Linux - C++

Your application should

- #include "Client.h"
- Link against "libViconDataStreamSDK_CPP.so"
- Redistribute
 - "libViconDataStreamSDK_CPP.so"
 - "libDebugServices.so"
 - "libboost_*-mt.so.1.xx.0"

The SDK was compiled with gcc version 4.8.2 (Red Hat 4.8.2-15 from devtools-2 for CentOS 5)

SDK Functions Listing

Appendix A: What's New

What's new in version 1.6.0

- New function calls:
 - EnableMarkerRayData
 - DisableMarkerRayData
 - IsMarkerRayDataEnabled
 - GetMarkerRayContributionCount
 - GetMarkerRayContribution

Requirements

- A compatible licensed version of Vicon Blade, Vicon Nexus, or Vicon Tracker must be present.
- LabVIEW will make use of the .NET dll, and has been found to function in versions 7.1 and 8.
- The MATLAB dll has been found to function in versions 7 and 8.
- The SDK has not been designed to allow access from Simulink.
- The Linux SDK has been specifically verified on CentOS 5.5, Ubuntu 8.04, Ubuntu 9.04, Fedora 9, and Fedora 11. It should also work on any platform supporting glibc 2.5 or later.

Function Result return values

Every function returns a data structure containing elements specified in the Output section of each method reference. Most functions return a Result item, which indicates the success or cause of failure for the function and useful for debugging purposes.

When a function has returned false, the output arguments are set to an appropriate default value:

- Booleans will be set to false.
- Integers will be set to zero.
- Doubles will be set to zero.
- Strings will be set to zero length.
- When the output argument is an array, all elements are set in this manner.

SDK Functions Listing

Appendix A: What's New

List of all SDK functions

Construction and Destruction

You can create many instances of the Vicon DataStream Client which can connect to multiple Vicon DataStream Servers

```
DataStream Servers.
C++
              C++ is object oriented, so use the class constructor.
                ViconDataStreamSDK::CPP::Client StackClient;
                Output SomeFunction Output = StackClient.SomeFunction();
              } // Client is implicitly destroyed as it goes out of scope
              ViconDataStreamSDK::CPP::Client * pHeapClient =
                                    new ViconDataStreamSDK::CPP::Client();
              Output SomeFunction Output = pHeapClient->SomeFunction(Input);
              delete pHeapClient;
MATLAB
              The MATLAB SDK is object oriented, and needs to be explicitly loaded and
              unloaded.
              Client.LoadViconDataStreamSDK();
              pHeapClient = Client();
              Output = pHeapClient.SomeFunction( Input );
              Client.UnloadViconDataStreamSDK();
.NET
              .NET is object oriented, so use the class constructor. Because objects are lazily
              garbage collected, your instance may outlive the last reference to it for some time. If
              the instance is pre-fetching frame data for you, then it can still use CPU and network
              bandwidth. Consider explicitly disconnecting prior to destruction.
              ViconDataStreamSDK.DotNET.Client pHeapClient =
                                     new ViconDataStreamSDK.DotNET.Client();
              Output SomeFunction Output = pHeapClient.SomeFunction( InputParam );
              // Signal to the garbage collector that it can clean up
              pHeapClient.Disconnect();
              pHeapClient = null;
```

SDK Functions Listing

Appendix A: What's New

Result

he Res	ult code indicates the success or failure of a	function.
	Unknown	The result is unknown. Treat it as a failure.
	NotImplemented	The function called has not been implemented in this version of the SDK.
	Success	The function call succeeded.
	InvalidHostName	The "HostName" parameter passed to Connect() is invalid.
	InvalidMulticastIP	The "MulticastIP" parameter was not in the range "224.0.0.0" – "239.255.255.255"
	ClientAlreadyConnected	Connect() was called whilst already connected to a DataStream.
	ClientConnectionFailed	Connect() could not establish a connection to the DataStream server.
	ServerAlreadyTransmittingMultcast	StartTransmittingMulticast() was called who the current DataStream server was already transmitting multicast on behalf of this clien
	ServerNotTransmittingMulticast	StopTransmittingMulticast() was called whe the current DataStream server was not transmitting multicasr on behalf of this clier
	NotConnected	You have called a function which requires a connection to the DataStream server, but on not have a connection.
	NoFrame	You have called a function which requires a frame to be fetched from the DataStream server, but do not have a frame.
	InvalidIndex	An index you have passed to a function is out of range.
	InvalidCameraName	The Camera Name you passed to a function is invalid in this frame
	InvalidSubjectName	The Subject Name you passed to a functio is invalid in this frame.
	InvalidSegmentName	The Segment Name you passed to a

About the SDK SDK Functions Listing Appendix A: What's New

		function is invalid in this frame.
	InvalidMarkerName	The Marker Name you passed to a function is invalid in this frame.
	InvalidDeviceName	The Device Name you passed to a function is invalid in this frame.
	InvalidDeviceOutputName	The Device Output Name you passed to a function is invalid in this frame.
	InvalidLatencySampleName	The Latency Sample Name you passed to a function is invalid in this frame.
	CoLinearAxes	The directions passed to SetAxisMapping() contain input which would cause two or more axis to lie along the same line, e.g. "Up" and "Down" are on the same line.
would result in		The directions passed to SetAxisMapping() would result in a left handed co-ordinate system. This is not supported in the SDK.
	HapticAlreadySet	Haptic feedback is already set
C++	<pre>namespace ViconDataStreamSDK { namespace CPP { namespace Result { enum Enum { Unknown, NotImplemented, Success, InvalidHostName, InvalidMulticastIP, ClientAlreadyConnected, ClientConnectionFailed, ServerAlreadyTransmittingMulticast, ServerNotTransmittingMulticast, NotConnected, NoFrame, InvalidIndex, InvalidIndex, InvalidCameraName, InvalidSubjectName, InvalidSegmentName, InvalidMarkerName, InvalidDeviceOutputName, InvalidLatencySampleName, CoLinearAxes, LeftHandedAxes, HapticAlreadySet }; }</pre>

```

SDK Functions Listing

Appendix A: What's New

GetVersion

Get the version of the Vicon DataStream SDK			
Input			
Output	Major	unsigned int	The major version number. When this number increases we break backwards compatibility with previous major versions.
	Minor	unsigned int	The minor version number. When this number increases we have probably added new functionality to the SDK without breaking backwards compatibility with previous versions.
	Point	unsigned int	The point version number. When this number increases, we have introduced a bug fix or performance enhancement without breaking backwards compatibility.
C++	<pre>// class Output_GetVersion // { // public: // unsigned int Major; // unsigned int Minor; // unsigned int Point; // 0utput_GetVersion GetVersion() const; ViconDataStreamSDK::CPP::Client MyClient;</pre>		
MATLAB	% [Output] = Ge MyClient = Clie	etVersion()	lient.GetVersion();
.NET	<pre>Output = MyClient.GetVersion(); // class Output_GetVersion // { public uint Major; public uint Minor; public uint Point; // }; // Output_GetVersion GetVersion(); ViconDataStreamSDK.DotNET.Client MyClient =</pre>

.NET	<pre>// class Output_Connect // { // public Result Result; // }; // // Output_Connect Connect(string HostName); ViconDataStreamSDK.DotNET.Client MyClient =</pre>			

SDK Functions Listing

Appendix A: What's New

ConnectToMulticast

Connect to a Vicon DataStream Server's Multicast stream. The stream content is managed by a client who calls StartTransmittingMulticast().

See Also: Connect, Disconnect, IsConnected, StartTransmittingMulticast, StopTransmittingMulticast

Stop i ransmittingiviuiticast			
Input	LocalIP	string	The DNS identifiable name, or IP address of the local Ethernet interface on which you wish to receive multicast data. You should not specify a port (any port specified will be ignored). e.g. "localhost" "10.0.0.2"
	Multicast IP	string	The IP Address of the Multicast group on which data will be received. The address should be in the range "224.0.0.0" – "239.255.255.255" You may also specify a port by appending it to the end of the IP Address after a colon. e.g. 224.0.0.0:30001. If you do not specify a port it will default to 44801.
Output	Result	Result	Result.Success Result.InvalidHostName Result.InvalidMulticastIP Result.ClientAlreadyConnected Result.ClientConnectionFailed
C++	<pre>// class Output_ConnectToMulticast // { // public: // Result::Enum Result; // }; // // Output_ConnectToMulticast // ConnectToMulticast (const String & LocalIP, // const String & MulticastIP); ViconDataStreamSDK::CPP::Client MyClient; Output_ConnectToMulticast Output = MyClient.ConnectToMulticast("localhost", "224.0.0.0");</pre>		
MATLAB	<pre>% [Output] = ConnectToMulticast() MyClient = Client(); Output = MyClient.ConnectToMulticast('locahost', '224.0.0.0');</pre>		
.NET	<pre>// class Output_ConnectToMulticast // { // public Result Result; // }; // // Output_ConnectToMulticast ConnectToMulticast (string LocalIP,</pre>

IsConnected

Discover whether client is connected to the Vicon DataStream Server. See Also: Connect, Disconnect Input Connected Output boolean True if you are connected to the stream, otherwise false. // class Output IsConnected C++ // { // public: bool Connected; // // }; // // Output_IsConnected IsConnected() const; ViconDataStreamSDK::CPP::CPP::Client MyClient; Output IsConnected Output = MyClient.IsConnected() // Output.Connected == false MyClient.Connect("localhost"); // (assuming localhost is serving) % [Output] = IsConnected() **MATLAB** MyClient = Client(); Output = MyClient.IsConnected() // Output.Connected == false MyClient.Connect("localhost"); Output = MyClient.IsConnected() // Output.Connected == true // (assuming localhost is serving) // public class Output IsConnected .NET public bool Connected; // }; // Output IsConnected IsConnected(); ViconDataStreamSDK.DotNET.Client MyClient = new ViconDataStreamSDK.DotNET.Client(); Output IsConnected Output = MyClient.IsConnected() // Output.Connected == false MyClient.Connect("localhost"); Output_IsConnected Output = MyClient.IsConnected() // Output.Connected == true // (assuming localhost is serving)

SDK Functions Listing

Appendix A: What's New

StartTransmittingMulticast

Ask the DataStream Server to start transmitting the data you are receiving directly to a Multicast address as well. This allows multiple clients to connect to your stream (via ConnectToMulticast()) whilst minimizing network bandwidth use and frame delivery latency.

See Also: Connect, ConnectToMulticast, Disconnect, StopTransmittingMulticast

Input	ServerIP	string	The IP Address of the server Ethernet interface from which the Multicast data will be sent. You should not specify a port number (any port number specified will be ignored)	
	MulticastIP	The IP Address of the Multicast group to which multicast data will be sent. The address should be it the range "224.0.0.0" – "239.255.255.255" You may also specify the port the data will be sent to by appending it to the IP Address after a colon e.g. 224.0.0.0:30001. If you do not specify a port it will default to 44801.		
Output	Result	Result	Result.Success Result.NotConnected Result.InvalidMulticastIP Result.ServerAlreadyTransmittingMulticast

SDK Functions Listing

Appendix A: What's New

SetBufferSize

Set the number of frames the client should buffer.

The default value is 1, which always supplies the latest frame.

Choose a higher number to reduce the risk of missing frames between calls to GetFrame. Higher numbers may introduce latency when frames are late.

See: GetFrame

Input	BufferSize	Integer	The maximum number of frames to buffer.
C++	<pre>ViconDataStreamSDK::CPP::Client MyClient; MyClient.Connect("localhost"); MyClient.SetBufferSize(10);</pre>		

SDK Functions Listing

Appendix A: What's New

SetStreamMode

There are three modes that the SDK can operate in. Each mode has a different impact on the Client. Server, and network resources used.

- In "ServerPush" mode, the Server pushes every new frame of data over the network to the Client. The Server will try not to drop any frames. This results in the lowest latency we can achieve. If the Client is unable to read data at the rate it is being sent, then it is buffered, firstly in the Client, then on the TCP/IP connection, and then at the Server. Once all buffers have filled up then frames may be dropped at the Server and the performance of the Server may be affected. The GetFrame() method will return the most recently received frame if available, or block the calling thread if the most recently received frame has already been processed.
- In "ClientPull" mode, the Client waits for a call to GetFrame(), and then request the latest frame of data from the Server. This increases latency, because we need to send a request over the network to the Server, the Server has to prepare the frame of data for the Client, and then we need to send the data back over the network. Network bandwidth is kept to a minimum, because the Server only sends what you need. We are very unlikely to fill up our buffers, and Server performance is unlikely to be affected. The GetFrame() method blocks the calling thread until the frame has been received.
- "ClientPullPreFetch" is an enhancement to "ClientPull" mode. A thread in the SDK continuously and preemptively does a "ClientPull" on your behalf, storing the latest requested frame in memory. When you next call GetFrame(), the SDK returns the last requested frame which we had cached in memory. GetFrame() does not need to block the calling thread. As with normal "ClientPull", buffers are unlikely to fill up, Server performance is unlikely to be affected. Latency is slightly reduced, but network traffic may increase if we request frames on behalf of the Client which are never used.

The stream defaults to "ClientPull" mode as this is considered the safest option. If performance is a problem, then try "ClientPullPreFetch" followed by "ServerPush".

See Also: GetFrame, GetLatencyTotal

Appendix A: What's New

SetAxisMapping

Remaps the 3D axis.

Vicon Data uses a right handed co-ordinate system, with +X forward, +Y left, and +Z up. Other systems use different co-ordinate systems. The SDK can transform its data into any valid right-handed co-ordinate system by re-mapping each axis.

Specify the direction of your X, Y, and Z axis relative to yourself as the observer. Valid directions are "Up", "Down", "Left", "Right", "Forward", and "Backward". Note that "Forward" means moving away from you, and "Backward" is moving towards you.

Common usages are

- Z-up: SetAxisMapping(Forward, Left, Up)
- Y-up: SetAxisMapping(Forward, Up, Right)

SDK Functions Listing

Appendix A: What's New

GetSegmentLocalRotationQuaternion

Return the rotation of a subject segment in local quaternion co-ordinates relative to its parent segment.

The quaternion is of the form (x, y, z, w) where w is the real component and x, y & z are the imaginary components. **N.B. This is different from that used in many other applications, which use** (w, x, y, z).

GetMarkerGlobalTranslation

Return the translation of a subject marker in global co-ordinates.

The Translation is of the form (x, y, z) where x, y & z are in Millimeters with respect to the global origin.

See Also: GetMarkerName

Input	Subject Name	string	The name of the subject
	Marker Name	string	The name of the marker.
Output	Result	Result	Result.Success Result.NotConnected Result.NoFrame Result.InvalidSubjectName Result.InvalidMarkerName
	Translation	double[3]	The translation of the marker
	Occluded	boolean	True if the marker was absent at this frame. In this case the Translation will be [0,0,0]
C++	<pre>// class Output_GetMarkerGlobalTranslation // { // public: // Result::Enum Result; // double</pre>		
MATLAB	<pre>% [Output] = GetMarkerGlobalTranslation(SubjectName, MarkerName) MyClient = Client(); MyClient.Connect("localhost"); MyClient.EnableMarkerData(); MyClient.GetFrame(); Output = MyClient.GetMarkerGlobalTranslation("Alice", "LASI");</pre>

SDK Functions Listing

Appendix A: What's New

GetDeviceOutputValue

Return the value of a device output. If there are multiple samples for a frame, then the first sample is returned.

The force plate data provided in the individual device channels is in a coordinate system local to the plate aligned Z upwards, Y towards the front of the plate. This coordinate system is located at the center of the top surface of the plate. Any plate origin offset has been accounted for in the moment data. These are forces not reactions.

See Also: GetDeviceCount, GetDeviceOutputCount, GetDeviceOutputName

Input	Device Name	string	The device name
	Device Output Name	string	The name of the device output.
Output	Result	Result	Result.Success Result.NotConnected Result.NoFrame Result.InvalidDeviceName Result.InvalidDeviceOutputName
	Value	double	The value of the device output
	Occluded	boolean	True if the value was absent at this frame. In this case the Value will be 0.
C++	// { // public: // Result::Enur // double // bool // }; // // Output_GetDev: // GetDeviceOu // const St // const St ViconDataStreamSI MyClient.Connect MyClient.EnableDe MyClient.GetFrame Output_GetDeviceOutput	<pre>// public: // Result::Enum Result; // double Value; // bool Occluded; // }; // Output_GetDeviceOutputValue // GetDeviceOutputValue(// const String & DeviceName,</pre>

```

SDK Functions Listing

Appendix A: What's New

GetDeviceOutputSubsamples

Return the number of samples available the specified device for the current frame. If an analogue device is sampling at 1000 Hz and the system is running at 100 Hz then this function will return 10.

The samples can accessed by supplying the subsample index to GetDeviceOutputValue. See below.

See Also: GetDeviceOutputCount, GetDeviceOutputValue

Input	Device Name	string	The device name	
	Device Output Name	string	The name of the device output.	
Output	Result	Result	Result.NotConnected Result.NoFrame Result.InvalidIndex Result.InvalidDeviceName Result.InvalidDeviceOutputName	
	DeviceOutputSubsamples	Uint	The number of subsamples for this device output.	
	Occluded	boolean	True if the value was absent at this frame. In this case the Value will be 0.	
C++	<pre>// { // public: // Result::Enum Result; // unsigned int Device() // bool Occlude // }; // // Output_GetDeviceOutp String & DeviceName, // String & DeviceOutputName ViconDataStreamSDK::CPP::C MyClient.Connect("localho MyClient.EnableDeviceData() MyClient.GetFrame(); Output GetDeviceOutputSubs</pre>	<pre>// { // public: // Result::Enum Result; // unsigned int DeviceOutputSubsamples; // bool Occluded; // }; // Output_GetDeviceOutputSubsamples GetDeviceOutputSubsamples(const String & DeviceName, // const String & DeviceOutputName) const; ViconDataStreamSDK::CPP::Client MyClient; MyClient.Connect("localhost"); MyClient.EnableDeviceData();</pre>

SDK Functions Listing

Appendix A: What's New

GetGlobalForceVector

Return the force vector for the plate in global co-ordinates.

The vector is in Newtons and is with respect to the global coordinate system regardless of the orientation of the plate. The vector represents the force exerted upon the plate, not the reaction force.

If multiple sub-samples are available this function returns the first subsample. See the alternate version of this function to access all of the analogue data.

See Also: GetGlobalMomentVector, GetGlobalCentreOfPressure

Input	Force Plate Index	unsigned integer	The index of the plate
Output	Result	Result	Result.Success Result.NotConnected Result.NoFrame Result.InvalidIndex
	ForceVector	double[3]	The force on the plate
C++	A valid ForcePlateIndex is between 0 and GetForcePlateCount()-1 // class Output_GetGlobalForceVector // { // public: // Result::Enum Result; // double ForceVector[3]; // // Output_GetGlobalForceVector // GetGlobalForceVector (// const unsigned int ForcePlateIndex) const; ViconDataStreamSDK::CPP::Client MyClient; MyClient.Connect("localhost"); MyClient.EnableDeviceData (); MyClient.GetFrame(); Output_GetGlobalForceVector Output = MyClient.GetGlobalForceVector(0);

Output_ GetGlobalForceVector Output = MyClient. GetGlobalForceVector(
0 );
```

SDK Functions Listing

Appendix A: What's New

GetGlobalMomentVector

Return the moment vector for the plate in global co-ordinates.

The vector is in Newton-Meters and is with respect to the global coordinate system regardless of the orientation of the plate.

The vector represents the moment exerted upon the plate, not the reaction moment. Any force plate origin offset is accounted for in the moments so they are acting about the exact centre of the top surface of the plate.

If multiple sub-samples are available this function returns the first subsample. See the alternate version of this function to access all of the analogue data.

See Also: GetGlobalForceVector, GetGlobalCentreOfPressure

Appendix A: What's New

${\sf GetEyeTrackerGlobalPosition}$

Returns the location of the eye. The position is in Millimeters with respect to the global origin. The segment and device data need to be enabled to get the position.

See Also: GetEyeTrackerCount, GetEyeTrackerGlobalGazeVector

Input	EyeTrackerIndex	unsigned integer	The index of the eye tracker	
Output	Result	Result	Result.Success Result.NotConnected Result.NoFrame Result.InvalidIndex	
	Position	double[3]	The eye position	
	Occluded	boolean	This is true if the segment that has the eye tracker attached is not visible. If true the position will be $(0,0,0)$.	
C++	// class Output_ // { // public: // Result::Enu // double // bool // }; // Output_GetEye // const unsigned in ViconDataStreamSI MyClient.Connect MyClient. Enables MyClient. Enables MyClient. Appendix A: What's New

GetEyeTrackerGlobalGazeVector

Returns the gaze direction as a unit vector in global coordinates. The gaze vector will be marked as occluded if the segment that has the eye tracker attached is not visible, the eye tracker is not calibrated or the pupil is not found. The segment and device data need to be enabled to get the gaze vector.

See Also: GetEyeTrackerCount, GetEyeTrackerGlobalPosition

Input	EyeTrackerIndex	unsigned integer	The index of the eye tracker	
Output	Result	Result	Result.Success Result.NotConnected Result.NoFrame Result.InvalidIndex	
	GazeVector	double[3]	The gaze direction vector	
	Occluded	boolean	This is true if gaze vector could not be calculated. If false the position will be (0,0,0).	
C++	// class Output // { // public: // Result::End // double // bool // }; // Output_GetEye // EyeTrackerIndex) ViconDataStreamSI MyClient.Connect MyClient.EnableS MyClient.EnableS MyClient.GetFrame	<pre>// { // public: // Result::Enum Result; // double GazeVector [3]; // bool Occluded; // }; // Output_GetEyeTrackerGlobalGazeVector GetEyeTrackerGlobalGazeVector(// const unsigned int EyeTrackerIndex) const; ViconDataStreamSDK::CPP::Client MyClient; MyClient.Connect("localhost"); MyClient. SDK Functions Listing

Appendix A: What's New

Appendix A – What's New

What's New in Version 1.0

- Full access to analog device data in Nexus. This can be scaled data or raw voltages.
- One SDK for all applications.
- Four segment rotation options: Quaternion, 3x3 row-major Matrix, Helical, and EulerXYZ format.
- Support streaming, request, and pre-fetch modes.
- Formats specific to C++, MATLAB and .NET.
- Version control.
- Result feedback for success criteria.

What's New in Version 1.0.1

- L++ programs that access the DS-SDK dll files can now be complied in Debug mode.
- New function calls for Vicon Tracker ***
 - ConnectToMulticast
 - StartTransmittingMulticast
 - StopTransmittingMulticast
 - GetLatencyTotal
 - GetLatencySampleCount
 - GetLatencySampleName
 - GetLatencySampleValue

What's New in Version 1.1.0

- Release of C++ and .NET SDKs on Windows x64.
- Release of C++ SDK on Linux x86.
- New function calls
 - DisableSegmentData
 - DisableMarkerData
 - DisableUnlabeledMarkerData
 - DisableDeviceData
 - GetMarkerParentName
 - GetSubjectRootSegmentName
 - GetSegmentParentName
 - GetSegmentChildCount
 - GetSegmentChildName
 - GetSegmentStaticTranslation
 - GetSegmentStaticRotationHelical
 - GetSegmentStaticRotationMatrix
 - GetSegmentStaticRotationQuaternion

^{***} These functions will not work with Vicon Nexus 1.4 and Vicon Blade 1.6.

SDK Functions Listing

Appendix A: What's New

- GetSegmentStaticRotationEulerXYZ
- Corrected some units. The values given by the SDK have not changed they were incorrectly labeled in previous versions.
 - "NewtonMillimetre" has become "NewtonMeter"
 - "Millimetre" has become "Meter"
- Corrected segment rotations following calls to SetAxisMapping()
- Added command-line options for the Test programs to specify a host to connect to.

What's New in Version 1.2.0

- Added C++ Linux x64 support
- Fix to support of .NET under Windows x64
- New function calls:
 - GetForcePlateCount
 - GetGlobalForceVector
 - GetGlobalMomentVector
 - GetGlobalCentreOfPressure
- Minor improvements to documentation.

What's New in Version 1.3.0

- New function calls:
 - GetFrameRate
 - GetEyeTrackerCount
 - GetEyeTrackerGlobalPosition
 - GetEyeTrackerGlobalGazeVector
 - GetDeviceOutputSubsamples
 - GetForcePlateSubsamples
- New overrides to function calls to allow access to all the analogue data:
 - GetDeviceOutputValue
 - GetGlobalForceVector
 - GetGlobalMomentVector
 - GetGlobalCentreOfPressure
- Minor improvements to documentation.
- Added Mac OSX support.

What's New in Version 1.4.0

- New function calls:
 - SetApexDeviceFeedback

SDK Functions Listing

Appendix A: What's New

What's New in Version 1.5.0

- New function calls:
 - EnableCentroidData
 - DisableCentroidData
 - IsCentroidDataEnabled
 - GetCameraCount
 - GetCameraName
 - GetCentroidCount
 - GetCentroidPosition

SDK Functions Listing

Appendix A: What's New

What's New in Version 1.6.0

SetAxisMapping() now works correctly with Blade (3.4+) regardless of whether the coordinate system in Blade is set to Y Up or Z Up.

New functions that Expose Marker Labels per Centroid information are now implemented. These allow the user to obtain data on the camera contributions of each marker within a client based upon the SDK.

- EnableMarkerRayData
- DisableMarkerRayData
- IsMarkerRayDataEnabled
- GetMarkerRayContributionCount
- GetMarkerRayContribution

SDK Functions Listing

Appendix A: What's New

What's New in Version 1.7.0

New functions to expose more detail about the quality of object tracking have been implemented

- GetObjectQuality
- GetCentroidWeighting
